FIG. 6 illustrates an exemplary embodiment of motion training process 600. Motion training process 600 learns new gestures and motions demonstrated by a user to be used for identifying existing or new commands. For instance, a user 201 may want to train the device 300 to detect a throwing motion, such as the motion of throwing the device 300 toward a television 210. The user first presses a switch on the hand-held device 300 to indicate that a new gesture is to be created. (Alternatively, the user can train the hand-held device 300 to interpret a motion as an indication that the training process should be executed.) Motion training process 600 initially waits for motion to be detected by one or more of the accelerometer sensors 410, 411, 412 (step 601) and then records the motion detected by the sensors 410, 411, 412 by periodically sampling and storing data read from analog to digital converters 415, 416, 417 (step 605). After each set of samples have been read during sampling step 605, a test is made to
